Here I few things I changed on my html code:

1. Sectioning and hierarchy a. Yours

Cakes — Choose Size & Flavor

is outside of a. Wrap each product category (Combos, Cakes, etc.) in its own for semantic clarity. b. Keep all product elements inside a container (e.g., products grid) so they can be styled consistently. 2. Forms inside products a. Each cake form is good, but you should wrap them in a with for accessibility. b. Add aria-label or descriptive button text, so screen readers know what's being added (e.g., "Add Custom Cake to cart"). 3. Consistency a. Add a. product class to all elements for uniform styling. b. Ensure all text is descriptive but concise (e.g., "Wedding cake with white icing" instead of just "Wedding cake"). 4. Cart Sidebar a. Great idea! But right now, it's just a placeholder. You'll eventually want JavaScript to update the

and totally dynamically. b. Wrap it in for clarity. 5. Footer a. Keep it consistent with your other pages (business hours, contact info, etc.).
